 The sequences given in R29144-46 are polymer fragments that are used in polymeric materials which have an inverse term; transition in the response of i.g. water and which expand against an exerted pressure. Pragments 1 and 2 are used such that mole fractions equal 1 in one polymeric material and fragments 1, 2 and 3 are used in a further polymeric material and fragments 1, 2 and 3 are used in a further polymeric material such that mole fractions equal 1. The materials can be used in a variety of applications to produce mechanical work and/or cause channical changes in a sealed environment by variation of the pressure on the material. The degree of mechanical or oftenical change can be controlled by selection of the number, hydrophobicity and size of the hydrophobic groups and the presence or absence of acattle functional groups in the polymer.

This sequence represents a repetative unit based on elastin. This sequence is used in combination with a repetative unit based on fibroin (slik) (see R0049). Polymers were constructed that consisted of alternating blocks of these two sequences (see R00515-R0057). The repeating units of these two sequences (see R00515-R0057). The repeating units of the polymers contained 2-12 units of the fibroin sequence. The polymers are used to form a derice (such as a surume; plu; thread, qui or film) to keeps separated viable tissue together. By varying the tentifies of the two repetative units, and by alterias the lengths of the blocks of each of them, the tensile properties of the polymer can altered moderatly. By reducing the momber of units of the elastin like repeat, a faster rate of resorption can be achieved.
 Protein polywer comprising alternating blocks of fibroin and elastin units – used to form a device e.g. a suture to keep separated viable tissus together.

Preparation of synthetic repetitive DNA - useful for construction of Targe procein polymers having repeating units, used in structural material, e.g. synthetic slik

WPI; 1998-193613/17.

This is the amino acid sequence of the peptide repeat unit, which is generally found in elastin, and used in the method of the invention, which involves the preparation of synthetic DNR, sequence having repeating units from about 3-15 codons and encoding a protein of at least about 10 kBc. The method is useful for the production of high molecular weight polymers (e.g. synthetic shik), either nucleic acids or peptides that are the expression products of the nucleic acids or peptides that are the expression products of the nucleic acids and which are useful as structural materials. Claim 11; Page 22; 127pp; English.

The peptides V5581-Y5589 represent examples of dispositic synthetic peptides V4501-Y5589 represent absellentant 30 or fewer amino acids, are water soluble, contain an amplibilic domain and have affinity for, and propessity to accomulate x, a site of vascular injury. They are preferably destried from the amino acid sequence of applipaproles, peptides can be used for the detection or imaging of a vascular injury or disease, e.g., atheroscierosis.
 The present sequence represents an example of a pentapeptide that is used in novel brolasarto podymers. The invention provides a method of tissue augmentation by injecting a polymer comprising repeating peptide monomeric units selected from nonzeptide, pentapeptide and tetrapeptide monomeric units where the monomeric units where the monomeric units form a series of beta-turns separated by dynamic bridging separates. The polymer has an inverse emperature transition value that is less than the tissue temp. and is injected in water solution at coacervate concentration. The polymer can be injected in that is less than the tissue temp. The polymer can be injected in the interpretation of incontinence or for cosmetic purposes), or into hard or soft incontinence or for repeat of transmitting in their period in the period in the period in the period period period period period. The polymer is nestoration of intervertebral discs.
 Blastomer; bioelastomer; polymer; tissue augmentation;
tissue restoration; tissue reconstruction; tissue repair; implant.
 Augmentation or restoration of mammalian tissue by injecting solution of peptide polymer, used for soft or hard tissue reconstruction, especially of intervertebral disks

 Gaps
 Inhibiting binding of low-density lipoprotein to vascular walls - by administering peptide with affinity for vascular injury sites
 Apolipoprotein fragment peptide #27 for vascular disease imaging.
 New disgnostic synthetic peptides which have affinity for and accumulate at a site of vascular injury useful for detection and imaging of vascular disease such as atherosciences.
 0;
 A movel method for inhibiting the binding of a low-density lipoproted in [Lib]. Ovesculbar walls; in vivo, comparises amountstering a synthetic water soluble periode containing an amphibilia Genain and having affinity for sites of vascular injury, e.g. derived from the present peptide. The peptide inhibits the hidding of Lib to vascular wall sommonents e.g. elastin and collagen, and so can be used to prevent or treat vascular diseases, e.g. atherosolarosis.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

linking component. The copolymer is useful in prostheric systems, for repairing a natural elastic system. It is so functionalised so as to provide reactive gas, which can become covalently cross-linked by tissue enzymes to newly synthesised connective tissue protein. The copolymer comprises is units of views, 5 suits of the block unit and 1 unit of haAnlaAnda. It has a mol. Wt. of 80000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transglutaminase cross-linkable copolymer; fibrinogen; beta-casein;

K6520/21/22 or K65223, and a second polyspetide monner selected from K65228-K6521, (the first monner can also be K6527). The copolymer can he used to produce tissue adhesives, wound repair formulations, rigided to produce tissue adhesives for nemperor of bote and off tissue studentes and carriers for controlled drug release compast; issue studentes and carriers for controlled drug release compast;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fibrinogen/beta-casein transglutaminase cross-linkable copolymer.

```

Trans:glutaminase cross-linkable peptide(s) - used in the mfr. of blocompatible, blo:adhesive tissue sealant and wound healing preparations.

Elastomeric; homopolymer; copolymer; tissue sealant; skin graft; Transglutaminase cross-linkable polypeptide elastomeric peptide.

ö

Gaps

```
Novel polypeptides optionally having one or both of the amino-terminus and carboxy-terminus flanked by an elastomeric peptide, which is cross-linkelb by a transglutaminase comprises a segment of formula: $17-$2. The present sequence represents a specifically claimed example of an elastomeric peptide. The homo- and copolymers produced are useful in tissue sealant and wound healing formulations. Tissue sealants are useful in skin grafting for burn victims and for sealing surgical and other wounds.

                                                                                                                                                                                                       The present sequence is used to make hybrid hay scallop abductin polypeptice sequences. Abducth is capable of channed-maintal transduction or inverse temperature transition. Abducth no plypeptides contain glycine-rich sequences. Abductin polypeptides are useful in the manufacture of drug delivery vehicles for administering water soluble drugs. The abductin polypeptides and their administering water account of the manufacture of known sequence of the manufacture of broad range of biomaterials ranging from light-weight durable fabric for clothing to matrices useful for human tissue and organ prostheses.
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Overexpression; bloelastic polypeptide; pantapeptide; tetrapaptide;

The invention relates to overexpressing a bicelastic polypeptide in a proxexytic host cell by introducing into the host cell a vector containing a promoter operably linked to a nucleic acid encoding a because to olypeptide, and growing the host cell for expressing the polypeptide. The blocalstic polypeptide especially comprises pentapeptide, tetrapecide, braxpeptide, or nonapoptide repeat units. The host cell is grown such that the overexpessed peptide is produced in inclusion bodies where the volume of inclusion hodies comprises 40-908 (w/w) of the total cellular volume of inclusion hodies comprises 40-908 (w/w) of the total cellular volume of the host cell that exhibit an inverse temperature transition in sequence represents the natural elastin tetrapoptide repeat from tropoelastin.

New DNA encoding a polymer with strands of repeating units of natural protein joined by intervening oispopeptide for producing high molecular weight polymers of amino acids

Claim 3; Column 143; 73pp; English.

This invention relates to DNA encoding a proteinaceous polymer. The polymer comprises strands of repeating units of a natural protein capable of assembling into aligned structures, with at least 2 strands joined by an intervening oligopeptide other than the repeating units, from the contract of intervening oligopeptide is unaligned and the polymer has individual intervening oligopeptide is unaligned and the polymer has individual producing pide of different repeating units. The DNA is useful for biologically and chemically active structural polymers. These polymers have used to provide a variety of structural polymers. These polymers may be used to provide a variety of structures for different purposes, and to provide a variety of structures for different purposes,

components, e.g. fibres, films, membranes, adhesives or emulsions, or with other composides or laminates. Peptide sequences B63971-B6391 represent monomer sequences which can be used in the polymers of the invention of 169oniciotale sequences F23370 - F23386 and amino acid sequences B63992 - B64003 are used in the construction of Sip and PCB-Sip polymers. Oligoniciotale sequences F23387 - F23397 and amino acid sequences B64003 - B64008 are used in the construction of Cip (Cipique II Me protein) polymers. Oligoniciotale sequences F23387 - F23409 and amino acid sequences B64009 - B64008 are used in the construction of Kerztin polymers. Oligoniciotale sequences F23409 and amino acid sequences B64009 - B64014 are used in the construction of Kerztin polymers. Proteins and peptides represented by sequences B64015 - B64049 are examples of polymers of the invention. 888888888888888

The primers and assays are used to detect NEBVS in a sample, to earcype these viruses, to diagnose enteroviral diseases and medical conditions, and to correlate (or disprove a correlation between) specific symptoms or combinations of symptoms with the presence of a particular enterovirus. They can be used for diseases such as aseptic meningitis. The detection of NEBV infections and helpods of treatment.

                                                                                                                                                                                                                                                                                            W06985-W07180 are antigenic peptides derived from either the product of the human crypt oncogene or the FIAG peptide (DYKDDK). The peptides are useful for coating beads used in a scintillation proximity assay for N-ceeptyglatotrosamine (GAIMCO, transferses (GNT) activity. The assay involves fever steps than known assays and is quicker, producing excellent signal-to-noise ratios. The assay is expendent signal-to-noise ratios. The absolute of screening large numbers of cycle, for their inhibitors and promoters of glycosylation (in partic. O-linked glycosylation).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps
                                                                                                                                                                                                                               Scintillation proximity assay for N-acetyl:galactosaminyl activity esp. for large scale screening of cpds. for their effect on enzyme activity
           SPA; scintillation proximity assay; antigen; bead coating; capture; articlydy; N-raceryl galactosamile transferase; GalNac transferase; activity; enzyme; 0-linked glycosylation.

Antigenic peptide, hepatitis C virus; HCV; non-A non-B; non-structural protein 4; non-reactive; NS4; Peptide derived from hepatitis C virus NS4 protein.

(USSH) US DEPT HEALTH & HUMAN SERVICES. (USSH) US SEC DEPT HEALTH.

```
The elastomeric material of the invention comprises a bioelastomer condy, repeating elastocato tetrapeptide or pentapeptide units opt. modified by hearaperide units, the units consisting of hydrophobic As residues and Garisting in a conformation having a beta-turn. The beta-turn of the the bioelastomer comprises of polypentapeptide unit of PROVG (see P91307) and/or IPGVG (see P91311), or a polyterrapetide of formula vexod (see P91311), or a polyterrapetide of formula vexod (see P91311), or XEGS (see P91312); and the hexapeptide repeating unit of formula vexod (see P91310), or XEGS (see P91312); and the hexapeptide
                                                                                                                                                                                                                                      Elastomeric polypeptide material - a useful for preventing adhesion between tissues and wound repair sites

Fragment of nematode alpha 3-tubulin.

Nematode; alpha 3-tubulin; aligned peptide array; protein binding site; protein interaction site; ligand detection.

Aligned peptide array - for detecting protein binding or interaction sites, etc.

Example 1; Page 5; 27pp; English.

This sequence represents a fragment of alpha 3-tubulin derived from a camebode. This sequence was used as a part of an aligned peptide array of the invention. The aligned peptide array of an aligned peptide array of the invention. The aligned peptide array of septide sequence of a part of the invention are aligned peptide array of protein into sequence sequence by dividing the amino acid sequence of the protein array on a protein; the amino acid sequences of the peptide sequence sequences of a protein; the peptides or the basis of the sequence sequence of peptides array on the basis of the sequence sequences of a protein in a method for the detection of a binding or interaction site of the method for the detection of a light of a protein, in a complete of the protein. The peptide array can consider a protein the array on the method for the detection of a protein; and in a method for the design of detected by them can be modified, or designed the array can also be used in a viroimmunosassy method, a method in the array can also be used in a viroimmunosassy method, a method or a protein array can also be incommunosassy method, a method in a viroimmunosassy method, a method or a protein or a protein and an array can also be also an array can array c WHA171

B. subtilis surface binding peptide ligand.

Bacterial spore; biopanning; phage-display library; Bacillus; vaccine; pathogen detection; biological warfare agent; B. anthracis.

Identifying peptides that bind to the surface of bacterial spores by blopaning phage-display library, useful as vaccines and diagnostic agents

Disclosure; Page 9; 23pp; English.

The invention provides peptides that bind to the surface of bacterial of spores. These peptides that bind to the surface of bacterial socses. These peptides are identified by bippaning a phage-display.

Inbrary with the spores The Ilbrary is incubated with spores and any complexes formed recovered by centritiughts. They are washed thoroughly, then plane eluted hapse and lifed. The procedure is repeated, for 3 or 4 rounds of panning, then individual clones purified, amplified and genomic DNA contracted for dermination of peptide-encoding sequences. Pertical Contracted for dermination of peptide-encoding sequences. Pertical spores, arthurdularly of the spores and identification of bacterial spores, arthurdularly of the spore shallow, and indentification of bacterial spores, or otherwise harmful species, in the environment (e.g. air, contracted for all control and indentification in protective apainst disease-casing spores (e.g. by incorporation in protective gainst disease-casing spores (e.g. by incorporation in protective gainst disease-casing spores (e.g. by incorporation in protective compass) and nvaccines to general assay. The peptides are species specific, i.e. they can differentiate between the possible biological warfare species and related species species specific, i.e. they can differentiate between the possible biological warfare agent control in the environment and interpresents a peptide that can bind to B. subtilis. THE TRANSPORT OF THE TR

GRAINS OF CYTOGHRONE C OXIDASE, THE TREATMLE OXIDASE IN
MITCHORNER, EUGETROOF TRANSPORT (BY SIMILARITY).

- CARALITY C FOTOLINY: 4 FERROCYTOCHRONE C + 0(2) = 2 H(2)0 + 4 FERROCYTOCHRONE C.

- SUBGEBLUIAR LOCATION: MITCHONDRIAL INNER XEMBRANE (BY SIMILARITY).

- SIMILARITY: BELONGS TO THE CYTOCHRONE C OXIDASE VIA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL. Submitted (MRR-1999) to the EMBL/GenBank/DDEJ databases.
-- FUNCTION: CAPALYZES AN AMIDORANSERERAE REACTION THAT GENERATES
-- INTEGNATION: CAPALYZES AND S-AMINOMIDABOL-4-CARBOXANIDE
-- SINGALDIAR LOCATION: TO USE TO PRINTE SYMHESIS.
-- SUBCLULAR LOCATION: OTTO HASH FAMILY.
-- SIMILARITY: BELONG OTTO HISH FAMILY.
-- SIMILARITY: BELONG OTTO HISH PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-CCT-2000 (Rel. 40.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó

Witcrosomal comegaé désaturase intron topologies contribute to our
understanding of reticulate evolution in Gossypium (Malvaceae) and the
evolution of reticulate evolution in Gossypium (Malvaceae) and the
submittee (Mar-1999) to the BMSJ/Genbank/DDSG databases.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
Novel DNA sequence encodes a polymer comprising segments of
respecting units of 3.9 amino acids from natural fibroin. 1.e. the
repeating units of 3.9 amino acids from natural fibroin. 1.e. the
into aligned structures formable into articles. The polymer
comprises at least 2 segments joined by an unaligned intervening
collopeptide, other than the repeating unit.
The polymer can be used to make fibres, films, membranes,
materials, caralysts, purificm, agents, compositive, laminates,
materials, caralysts, purificm, agents, compositive, laminates,
configurable intervenials. Typical applications include yound
biological materials. Typical applications include yound
configurable in its protections include yound
configurable in the intervening oligopeptide
can provide a ligand for binding a mol, anthody, etc., or a
femically reactive site for coupling to proteins, cr., or a

(PROT-) PROTEIN POLYMER TECHNOLOGIES INC.

New DNR encoding a polymer with strands of repeating units of natural protein joined by intervening oligopeptide for producing high molecular weight polymers of anino acids.

Example 2; Column 49-50; 73pp; English

This invention relates to DNA encoding a proteinaceous polymer. The Copymer comprises strands of repeating units of a natural protein capable of assembling into a ligned structures, with at least 2 strands joined by an intervening oliopoppide other than the repeating units. The DNA is an intervening oliopoppide is unaligned and the polymer has individual strands of the same or different repeating units. The DNA is useful for the producing thin molecular weight polymers of annio exide based on biologically and clemically active structural polymers. The DNA is useful for biologically and chained and/or structural polymers, or and to produce articles including coatings, or other (non)structural components, e.g. fibres, films, membranes, ablesives or emulsions, or with other compounds and/or compositions to form composites or insintee. The pulpage of the invention of lignonlectide sequences 16377 being and only or sequences 16402 being an exact of the construction of LR (collagenings) being an exact of the construction of LR (collagenings) being sequences 164003 are used in the construction of CLP (collagenings protein) bolymers of Jugonulectide sequences 164003 and annio acid sequences 164003 - 164003 are used in the construction of CLP (collagenings protein) bolymers of Jugonulectide sequences 164003 are used in the construction of Reratin polymers. Proteins and populates of the invention.

DNA encoding protein contg. repeated fibroin derived segments

```
of assembling into aligned structures, with at least 2 strands joined by an intervening oligopeptide other than the repeating units. The contract of the same of different repeating units. The same of different repeating units. The strands of the same or different repeating units. The DNA is useful for producing high molecular weight polymers of amino acids based on biologically and chemically active structural polymers. These polymers or may be used to provide a variety of structure for different purposes, and to produce articles including coatings, or other (non)structural components, e.g. fibres, fills, membranes, adhesives or amulsions, or with other compounds and/or compositions to form composites or laminates. CC Peptide sequences B6391-B63991 represent morners sequences M0391-B63991 represent morners sequences M0391-B63991 represent morners sequences CC 13370 · 723387 and amino acid sequences B64003 - B64002 are used in the construction of CLP (collagen like protein) polymers. Oligonuclectic sequences F630397 - F33397 and amino acid sequences B64003 - B64004 are sequences F64013 and amino acid sequences B64009 - B64044 are created by sequences B64015 - B64049 are examples of polymers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bay scallop; abductin; chemomechanical transduction; drug delivery; increse temporature transition; water soluble drug; blomaterial; fabito; organ proethesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to DNA encoding a proteinaceous polymer. The polymer comprises strands of repeating units of a natural protein capable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New DNA encoding a polymer with strands of repeating units of natural protein joined by intervening olicopaptide for producing high molecular weight polymers of amino acids
                                                                                              Novel DNA sequence encodes a polymer comprising segments of repeating units of 3-9 amino acids from natural fibroin. 10. the corest size of 3-9 amino acids from natural fibroin. 10. the present sill like protein (SELP) SLFF sequence, able to assemble into adjuned structures formable into articles. The polymer comprises at least 2 sequents joined by an untaligned intervening colyopeptide, other than the repeating unit.

The polymer can be used to make fibres, films, membranes, and stons, ocalings, etc. useful as, e.g. specific binding materials, catalyses, purificm, agents, composities, laminates, and message, attinity columns and supports for biological materials. Typical applications include sound caresings, and in vivo protheses. The polymer produces articles with good mechanical properties, and the intervening oligopeptide can provide a ligand for binding a mol. antibody, etc., or a con provide site for coupling to proteins, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Proteinaceous polymer; repeat unit; structural polymer; coating; film; fibre; membrane; adhesive; emulsion; laminate; karatin; collagen.

```
The present sequence represents a bay scallop abductin polypeptide. The polypeptide is capable of chemomechanical transduction or inverse temperature transition. Abductin polypeptides contain sylvine-rich sequences. Abductin polypeptides are useful in the manufacture of drug delivery vehicles for administering water soluble drugs. The abductin polypeptides and their derivatives are also useful in the manufacture of broad range of biomaterials ranging from light-weight oursin for clothing to matrices useful for human tissue and organ prostheses.
The polypeptide is capable of chemomechanical transduction or inverse temperature transition. Adductin polypeptides contain glycine-rich sequences. Adductin polypeptides are useful in the manufacture of drug dalyary vehicles for administering water soluble drugs. The adductin polypeptides and their derivatives are also useful in the manufacture of broad range of biomaterials ranging from light-weight durable fabric for clothing to matrices useful for human tissue and organ prostiness.

```
cDNA fragment encoding tropoelastin - has inhibiting activity towards platelet aggregation and is useful for prophylaxis of arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The CDMs was sequenced from a clone prepd. from mRNA isolated from folicken corta tissue. It can be used to produce tropoclastin which is a precurror of elastin which does not have desmosine, isodesmosine and lysynoylleusine residues and isn't cross-linked.

Query Match

Sequence 136 AA;

```
The present sequence represents mouse occludin, a novel adhesion matches which is a constituent protein of manbrase tight junctions. Antibodies raised against the protein are used to assay for occludin in samples, and for the study of occludin localisation in membranes arthodies, not controlled the study of occludin localisation in membranes antibodies are used for streening of substances which proteinally intinence cocludin expression. The studence decived from the DNA encoding the present sequence are used for treatment of disorders involving the DNA encoding harine, publication of the section of the cocludin part of the occludin parts and the occludin DNA sequence can be used to detect occludin DNA by POR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding human, dog and mouse occludin(s) - useful for screening for substances influencing occluding expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         High strength film; fibre, woven article; parachitee; salis; absorber; body armour; heavy metal; biological weapon; chemical; flavour; fraprance; Nephila clavipes.

A process has been developed for the production of a DNA fragment conding stalk protein. The process involves: (a) selecting trapet DNA, from a silk protein. The process involves: (a) selecting trapet DNA, from a silk protein specific the regions: (b) selecting a single-stranded DNA primer of at clear 10 nucleotides with a segmence that is complementary to a region of the target: (c) repetitively combining the primer with malted target DNA, incubating the mixture with nucleotides and a DNA polymerase with profreading activity to produce a DNA fragment which is complementary to the target and is the last 2 kD houg the present sequence encodes the spider silk protein from Nephila claripes. The DNA fragment can be considered in the spider silk protein from Nephila claripes. The DNA fragment can be considered to the spider silk protein from Nephila claripes. The DNA fragment can be conserved to commercial scale (at over 2 gl. cell ness). It has better tensile commercial scale (at over 2 gl. cell ness). It has better tensile and non repetitive regions ensures isolation of stable clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 646 AA;
